Bi-directional Variable Stiffness Magnetorheological Elastomer (MRE) Design
Sarah Trabia
M.S. Student, Department of Mechanical Engineering, University of Nevada, Las Vegas,
Email: trabias@unlv.nevada.edu

What is MRE?
- MRE is a semi-active silicon with embedded iron particles for variable stiffness changes under external magnetic flux

Research Objective
- Feasibility of using MRE as a haptic feedback device.
- Design a MRE device that can increase or decrease the stiffness.
- Design an effective way of providing a “pre-strain” to the base silicon material.

Computational Simulation
- COMSOL 4.3b Finite Element Analysis
- 2D axisymmetric model
- Parametric sweep was run to find the amount of current needed to counteract the permanent magnet.

MRE Composition

<table>
<thead>
<tr>
<th>Components</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Silicone Resin and curing agent (R-2652)</td>
<td>Base of the MRE</td>
</tr>
<tr>
<td>Iron Powder (98%, spherical powder, 1-6 micron size particles)</td>
<td>Active component</td>
</tr>
<tr>
<td>Toluene</td>
<td>Solvent</td>
</tr>
<tr>
<td>3-glycidyloxypropyltrimethoxysilane (GPTMS)</td>
<td>Silane coupling agent</td>
</tr>
</tbody>
</table>

MRE Fabrication Procedure
- MRE without silane agent: Silicone resin was dissolved in toluene at 60°C and Iron particles were added and stirred vigorously for an hour
- MRE with silane agent: GPTMS was dissolved in toluene at 60°C for 1 hour and Iron particles were added and modified in the prepared solution at 80°C for 3 hours. Silicone resin was added and dissolved at 60°C for an hour
- The curing agent was then added to both mixtures.
- Vacuum was applied to remove bubbles in the mixture for 30 minutes.
- The mixture was poured into a glass dish and cured in an oven at 90°C overnight.
- For the magnetically cured samples, they were put in between two coils in the oven.

MRE Results
- Samples of MRE will be tested in the Bose Dynamic Mechanical Analysis (DMA) for shear modulus, stiffness, and damping.
- Each test has seven conditions from 1 to 7 Hz with an amplitude of 0.4 mm
- An initial displacement of 1 mm is applied so that every test starts from the same reference point
- The field is ranged from 0 to 25 mT

Future Work
- Finish testing the samples and analyze the data
- Control system will include a magnetic field sensor and a load cell.
