## INTRODUCTION

The present report is a biological inventory in conjunction with the Las Vegas Wash Unit, Colorado River Basin Salinity Control Act, Title II. The location and limits of the project are shown in Fig. 1. The boundaries of the project encompass sections of North Las Vegas, Las Vegas, East Las Vegas and areas along Las Vegas Wash extending to its drainage point in Las Vegas Bay in Lake Mead. Therefore, it encompasses a wide array of ecological situations and landscapes ranging from essentially natural to various stages of urban development.

This biological inventory presents basic ecological classifications, descriptions of vegetation, lists of vascular plants and vertebrates known to occur in the area. Each major group, i.e., plants, fish, amphibians, reptiles, birds and mammals are characterized ecologically by biotic community. Basic life history data are given for all species of vertebrates found on the project area. Species of special status such as threatened, endangered, protected or of game status are further discussed.

Previous reports including biological data are the four quarterly reports from the Las Vegas Valley Water District to the Governor and the Legislative Commission (Sept. 1, 1971; Dec. 1, 1971; Mar. 1, 1972; June 1, 1972). The first three reports include summaries of the quarterly reports from the University of Nevada, Las Vegas on the study by Bradley and Niles (1973) whereas, the June, 1972 report includes a summary

of the final report of Bradley and Niles (1973).

The report by VTN Nevada and Jones and Stokes Associates, Inc., (Nov. 15, 1972) to the Las Vegas Valley Water District includes biological data from essentially these sources, Bradley and Deacon (1967); Bradley and Niles (1973) and a checklist of the avifauna by Mr. C. S. Lawson. Their report as a whole, however, shows a lack of knowledge and ecological awarness of the Mojave Desert and Las Vegas Valley area and, therefore, it is a misrepresentation of the biota and ecology of Las Vegas Valley.

#### METHODS AND PROCEDURES

This report is based largely upon the significant literature, University of Nevada, Las Vegas biological museum and herbarium records, unpublished data of current investigators and previous reports by Bradley and Deacon (1967), Bradley and Niles (1973), Miller (1974), and Deacon (1975). Biotic community classification is basically that developed for Southern Nevada by Bradley and Deacon (1967). Basic checklists of plants and vertebrate animals are based on the above sources and other works which are cited in the appropriate sections. Mapping of the vegetative components by biotic community was based on general reconnaissance of the study area in correlation with analysis of aerial photographs supplied by the Bureau of Reclamation.

We wish to credit the efforts of the following individuals who aided in the compilation of this report: Dr. James E. Deacon and Mr. John R. Baker supplied and analyzed the ichthyological and limnological data. The basic checklist of the avifauna was supplied by Mr. C. S. Lawson, who has been compiling avian data in the southern Nevada area for over a ten year period. Dr. Michael J. O'Farrell supplied distributional and life history data for the bats of the southern Nevada area. Mr. James Holland and Mr. Dennis Schramm compiled portions of the plant checklist and assisted in the vegetative mapping of biotic communities.

#### BIOTIC COMMUNITIES

Biotic communities are natural assemblages of plants and animals which occupy a particular area. Since many animals, particularly vertebrates, occupy more than one community, biotic communities are best recognized and determined on the basis of vegetation. Biotic communities of southern Nevada have been classified and discussed by Bradley and Deacon (1967) and with some modification for the present report are listed in Table 1. Brief characteristics of each community are given below. A list of total acres and percent of total acreage for each biotic community is given in Table 2.

Creosote Bush Community. Creosote bush communities are widespread and make up the dominant biotic community at

Table 1. Classification of biotic communities for the study areas of the Las Vegas Wash Unit, Colorado River Basin Salinity Control Act, Title II, Study Area.

Biotic Community:

I.Terrestrial

Zonal Community Type

Desert Shrub Vegetation Type

Creosote Bush Community

Transzonal Community Type

Desert Shrub Vegetation Type

Salt Bush Vegetation Community

Shrub and Woodland Vegetation Type

Desert Riparian Community

Riparian and Cliff Community

Transitional Riparian Community

Azonal Community Type

Barren Community

Urban Community

II.Hydric and Aquatic.

Marsh Community

Open Water Community

- 1) ponded (including Las Vegas Bay)
- 2) moving

elevations below 4,000 feet in the Mojave desert. This is the most commonly encountered community in the study area occupying approximately 9,960 acres (68.6% of the total area). It is found in both flat and mountainous terrain except in areas of large rock outcroppings (barren areas) or well-developed dry wash systems. Co-dominants of this community are creosote bush and burro bush. Commonly, burro bush is more abundant and occupies more foliar cover than creosote bush, however, the community is named for the more widespread species. Vegetative cover is sparse and usually varies between 1 to 5% ground cover (Bradley, unpublished data).

Saltbush Community. Saltbush communities commonly occur as a mosaic in relation to the drainage systems where some accumulation of soil salts occur (usually between 1 to 6%; the percentage of salt in air dry soil is approximated by multiplying the 1.5 conductivity reading by 0.3, after Richards, 1954). Common plant indicators are species of Atriplex, commonly called saltbush, particularly shadscale, wingscale, cattle spinach and quailbush. In more saline portions of the community, halophytes such as inkweed and pickle-weed dominate. Ground cover is usually high compared to creosote bush, ranging from 6 to 20%. Stands of this community are widely scattered throughout the study area occupying approximately 420 acres (2.9%) of the total area).

Table 2. Total acres and percent of total acreage of biotic communities in the Las Vegas Wash Unit, Colorado River Basin Salinity Control Act, Title II Study area

| Biotic Community                      | Total Acres | Percent of Total Acreage |
|---------------------------------------|-------------|--------------------------|
| Creosote Bush                         | 9,960       | 68.6                     |
| Saltbush                              | 420         | 2.9                      |
| Riparian Cliff                        | 200         | 1.4                      |
| Transitional Riparian                 | 1,650       | 11.4                     |
| Barren                                | 410         | 2.8                      |
| Urban                                 | 220         | 1.5                      |
| Marsh                                 | 1,100       | 7.6                      |
| Open Water(excluding Las Vegas basin) | 60          | 0.4                      |
|                                       | 14020       | 96.6                     |
| Desert Riparian                       | 420         | 2.9                      |
|                                       | 14460       | 99.5                     |
|                                       |             | 2.0                      |
|                                       |             | 99.9                     |

Desert Riparian Community. Desert riparian communities are associated with drainage systems where there is significant wash expansion and associated mesic conditions. Vegetative composition may be similar to that of the creosote bush community, but exhibits more luxuriant growth and higher plant cover. In larger washes, however, there are definite plant indicators such as cheesebush, mesquite, catclaw, desert willow, and occasionally salt cedar. Plant cover is higher than surrounding desert scrub community and usually varies between 5 to 40%. Approximate acreage for this community in the study area is 420 (3.3% of the total area).

Riparian Cliff Community. This community commonly occurs along washes, canyons, cliffs and rimrock areas at elevations above 5,000 feet. Small areas of cliff and rimrock found on the study area might be considered as lower extensions of this community, however, vegetative composition is primarily that of associated communities. These areas are so small in extent that they are not mappable at the scale of the vegetative map. Ground cover in this community varies between 3 to 10%. Approximate acreage for this community within the study area is 200 acres (1.4% of the total).

Transitional Riparian Community. Transitional riparian community as considered in this report is largely comparable to the stream riparian as described by Bradley and Deacon

(1967). It occupies various areas adjacent to the Las Vegas Wash where permanent water is found. It is also encountered in other sections of the study area where the water table is near the surface. The vegetative structure is either shrub woodland or woodland depending upon the location. Dominant woodland species include salt cedar, honey mesquite and occasionally cottonwood. Associated shrubs are usually halophytes such as inkweed, pickleweed or quailbush. Cover varies greatly ranging from approximately 15 to 100%. Approximate acreage for this community within the study area is 1,650 acres (<sup>11.8%</sup> 11.4% of the total area).

Barren Community. Barren communities are those which largely lack vegetative cover and occur in association with areas of extreme rock exposure. Approximate acreage for this community is .410. (2.8% of the total).

Urban Community. This community is best characterized by the presence of man-made development, i.e., housing, roads or disturbance of the naturally occurring vegetative community usually in the form of grading or ground leveling. This community occurs in many forms ranging from closely spaced housing developments to widely spaced many aced ranches. Quite often, the urban development of an area forms a mosaic pattern interspersed with the natural vegetation. In these situations, vegetative mapping is difficult and separation of the urban sections from surrounding plant communities was impossible to show on paper. This form of development occupies 220 acres (1.5% of the total area) within the study area.

Marsh Community. This community is restricted in distribution to the drainage system commonly referred to as Las Vegas Wash. It is characterized by emergent hydrophytic plant species which are associated with standing water or extremely wet soil. The dominant plant species are cattail and bulrush and in some instances, common reed grass. Plant growth varies greatly in size and may, in some instances, form extensive stands of tangled growth, which often exceed 100% ground cover. This community occupies approximately 1,100 acres(7.6% of total area) in the study area.

Open Water Community. This community is found along the stream portion of Las Vegas Wash and Las Vegas Bay as included in this report. It may be separated into the stream portion representing moving water and areas of standing water including Las Vegas Bay. There are also many small ponds along the Las Vegas Wash including man-made tailing and evaporation ponds below the County and City Sanitation plants. These ponds are considered open-standing water and the vegetation associated with them is the same described for the marsh community.

The vegetation along the shoreline of Las Vegas Bay is primarily transitional riparian although some marsh vegetation does occur at the mouth of the larger coves and inlets.

Exclusive of Las Vegas Bay, mapping of open water was impossible in that the bodies of open water found on the

study area are all very restricted in size. With the exception of the tailing ponds, most of which are dry, no significant body of open water (40 acres or greater) exist in Las Vegas Wash.

A crude estimate of the acreage of open water exclusive of Las Vegas Bay, is 60 acres (0.4% of total area) within the study area.

#### VASCULAR PLANTS

A total of 227 species representing 41 families are included in the basic list. The more important families are Compositae (49 species), Graminae (21 species), Cruciferae (13 species), Leguminosae (12 species) and Polemonaceae (11 species). This is a reasonable representation of the number of families and species in a desert area. Some additional species, especially annuals, could be added to the checklist by intensive study. This is particularly true for creosote bush and desert riparian communities.

The distribution of plant species in the various biotic communities is given in Appendix I and a comparison of plant species diversity is shown in Table 3. The low number of probable and hypothetical species on the list are due to: 1) a reasonably adequate knowledge of species distributions for the biotic communities except barren and urban and, 2) a conservative approach for listing probable and hypothetical distributions. With adequate study, a much larger list of weedy species associated with urban habitats could be

Table 3. Comparison of plant species diversity in different biotic communities in the Las Vegas Wash Unit, Colorado River Basin Salinity Control Act, Title II, Study Area.

| Total                          | 210              | 65            | 173                | 17                       | 25                            | 13    | 5             | 16     | 19    |

developed. Creosote bush and desert riparian communities show the highest plant species diversity with many abundant and common species. Both communities are widespread and share many species in common and represent the bulk of plant species found in the lower desert. The saltbush community which ranks third in total species has a relatively low species diversity, especially of annuals, due to an increased perennial cover and high salinity which is unsuitable for germination of many desert species. Transitional riparian and marsh communities are low in diversity due to the greatly increased plant cover of dominant species. The low species diversity for open water and barren communities is apparent, since they represent unsuitable habitats for terrestrial plant development. The riparian cliff community is not well established and extremely limited in area due to the low elevation, hence plant species diversity is low.

#### HISTORICAL VEGETATIVE CHANGES IN LAS VEGAS WASH

Las Vegas Wash represents the lower portion of natural drainage system, Pluvial Las Vegas River, which drains into the Colorado River at Lake Mead (Hubbs and Miller, 1948). This ancient stream course can be traced from Indian Springs south to Corn Creek Spring, Tule Springs, Las Vegas Creek and into Las Vegas Wash. Recent studies provide a general picture of environmental changes over the last 30,000 years (Haynes, 1967; Mehringer, 1967). At the beginning of this time span, Pluvial Las Vegas River was fully functional, discharging into the Colorado River. From approximately

30,000 to 15,000 years, Pluvial Lake Las Vegas occurred as a widespread, shallow lake over much of the valley. During the period 14,000-6000 years ago, Indian Springs, Corn Creek Spring, Tule Springs and numerous springs in the vicinity of present day Las Vegas were active and drained into Pluvial Las Vegas River. Later, with increased aridity and lowering of the water table, spring activity decreased and sometime between 4,000 and 1,000 years ago Pluvial Las Vegas River became largely a dry wash.

Early explorers moved up Las Vegas Wash toward an oasis of spring-fed meadows at the present site of Las Vegas. After settlement by the Mormons in the 1850's, cattle ranches occupied much of the valley and artesian <sup>wells</sup> springs were used to cultivate crops of hay. Rapid population growth and increased water utilization since the 1930's have resulted in a rapid and continuing decline in ground water levels. Few springs in Las Vegas Valley are now active and Vegas Creek, the last remnant of Pluvial Las Vegas River, largely dried up in the late 1940's (Bradley and Deacon, 1967). Water now entering Las Vegas Wash is largely effluent and some underground seepage.

The present transitional riparian, marsh and open water communities are now maintained largely through effluent and an unknown amount of underground seepage. As a result of the bulk of water being nutrient rich, effluent marsh communities exhibit a higher productivity and standing crop than stands originally occurring in Las Vegas Wash before sewage treatment

plants were present. Total acreage of marsh and associated communities has declined drastically, however, with lowering of the water table, decreased spring activity, drying up of Las Vegas Creek, and increased urbanization of Las Vegas Valley.

#### VERTEBRATE ANIMALS

The ecological distribution and characterization of life histories of vertebrates are discussed in appropriate sections by vertebrate class.

##### FISH

Habitat Description. Waters in Las Vegas Wash are characteristically high in nutrients and total dissolved solids (TDS) and flow through a Cattail-Bulrush Marsh community. The Clark County and Las Vegas sewage treatments contribute both to the total flow and nutrients in Las Vegas Bay.

Nutrient enrichment from Las Vegas Wash has resulted in algal blooms and polluted eutrophic conditions in Las Vegas Bay. Conditions in Boulder Basin have remained naturally eutrophic because of dilution and utilization of nutrients in Las Vegas Bay (Deacon, 1975). Nutrient levels are summarized in Table 4.

Lake Mead is a warm monomictic lake with thermal stratification developing in May. A thermocline becomes established at 15-20 meters in July and August when water temperature reach 30-35°C. Mixing begins in September and is completed by December when water temperatures are 9-10°C.

During summer stratification a negative heterograde oxygen

profile develops in association with the thermocline throughout Lake Mead. Metalimnetic oxygen depletion has been most severe in Las Vegas Bay where oxygen levels below 1 mg/l have been found. In Boulder Basin oxygen levels usually do not fall below 2 mg/l in the metalimnion. Oxygen concentrations in the hypolimnion do not become depleted, remaining 60-70% saturated through summer stratification.

Distribution and Life Histories. The distribution and life histories of fishes in Las Vegas Wash and Boulder Basin are summarized in App. II (Jonez and Sumner, 1954; Deacon, 1971; Lockard, 1971 and 1972; Wood, 1973 and 1974; Padilla, 1975). The Western Golden Shiner (Notemigonus chrysoleucus) and the Bonytail Chub (Gila robusta) have been reported in the lower basin (Jonez and Sumner, 1954). The presence of the latter has not been reported and probably no longer occurs in the lower basin. The Western Golden Shiner has been heavily used as live bait and may have established small populations in Lake Mead.

There are a number of factors limiting or regulating reproduction and distribution of fishes in Lake Mead. Allan and Romero (1975) have determined that fluctuating water levels, wind and wave action, water temperature and predation can affect nesting success of Largemouth Bass and poor survival of fry may be the result of limited food supply. These factors would also affect Green Sunfish, Bluegill and Black Crappie which utilize very similar habitat. Reproduction of Salmonids does not occur because of the absence of migratory streams although

*early part*

they do become reproductively active in the fall. High water temperatures in the epilimnion and low oxygen levels in the metalimnion limit the distribution of Salmonids to the hypolimnion during summer stratification. Oxygen levels also limit the occurrence of warm water fishes in the metalimnion for any extended period although large populations of Shad have been observed in this region (Deacon, 1975).

Biological and Economical Importance. Of the 12 species of fish in Boulder Basin, only three are non-game fish, Threadfin Shad, Humpback Sucker, and European Carp. Threadfin Shad are the main forage base for most of the game fish and its introduction has helped improve the fisheries in Lake Mead. The European Carp is a very abundant and undesirable fish and has been reported as predators on Largemouth Bass nests (Allan and Romero, 1975) and may have some effect on game fish populations.

Largemouth Bass made up 40% of the catch composition in 1974 and were the most important game fish followed by Black Crappie, Channel Catfish, Rainbow Trout, and Bluegill (Padilla, 1975). Coho Salmon, Cutthroat Trout and Striped Bass made up less than 3% of the 1974 catch.

The Mosquitofish has been introduced as a means of mosquito control. Its presence in Las Vegas Wash may have some limited effects on insect populations.

Of the 12 species of fish found in the Boulder Basin, one, the native Humpback Sucker, is listed as threatened on the Nevada endangered species list (see Table 7).

## AMPHIBIANS

The ecologic distribution and comparative abundance of amphibians by biotic community is given in App. III. Woodhouse's Toad is the only amphibian which may be found within the more mesic portions of terrestrial communities which are not in close contact with marsh or open water. All of the species listed occur in marsh open water and transitional riparian with the exception of the Tiger salamander, whereas the more aquatic species, the bullfrog, leopard frog, red-spotted toad and pacific tree frog are most abundant in marsh and open water. The introduced tiger salamander represents a special case, in that it was first found in the middle 1960's in Las Vegas in association with urban development (Bradley and Deacon, 1966). At the present time, the species also occurs in marsh and open water.

List history information for amphibians is given in App. IV. All species show reduced activity and/or hibernation during the colder months in the Las Vegas area. The only species with a special status is the bullfrog, which is protected by state game laws. No amphibian species are listed as threatened or endangered on either the Federal or State lists.

## REPTILES

Distribution and relative abundance of reptiles is given in App. V. There are no reptile species which are characteristic of marsh or aquatic water communities except the western soft shell turtle. Fourteen species of snakes occur on the study area with their primary associations in terrestrial communities,

especially creosote bush and desert riparian. In some instances, however, certain species such as the red racer, the gopher snake and the sidewinder are abundant in habitats adjacent to water such as riparian cliff and transitional riparian as these areas have an abundant food supply.

Several snakes including the sidewinder are present in the urban communities.

Thirteen species of lizards are found on the study area and with few exceptions, are most abundant in creosote bush or desert riparian communities. The chuckawallas find suitable habitat in some areas considered as barren. The yucca night lizard is common in transitional riparian and urban habitats where litter is available for shelter.

The desest tortoise is common in creosote bush, desert riparian and urban communities. This species is protected by state law and is considered by some authorities to be threatened or endangered because it is often killed while crossing highways and is often kept in captivity by man. Studies in progress in the Las Vegas area show that it is common or even abundant in suitable habitat adjacent to highways and in areas of high recreation use.

The Gila Monster, like the Desert Tortoise, is also protected by state law (see Table 7).

Life history information for reptiles is shown in Appendix VI. As expected, due to their poikilothermic nature, reptiles are largely inactive or in hibernation

during the colder months. Smaller species, however, such as the side-blotched lizard and sidewinder do exhibit some above-ground activity on warm days during the winter months.

## BIRDS

The seasonal use, occurrence and abundance of the avifauna in the study area is given in Appendix VII. These data represent material taken from several sources including: Austin and Bradley, (1971); Bradley and Deacon, (1967); Miller, (1974); and Austin, (unpublished data). The basic species list was compiled by Mr. C. S. Lawson.

The diversity of birds within the study area is quite high. A total of 246 species representing 50 families occur here. The heaviest utilization of both the developed area of Las Vegas and the marsh condition found in Las Vegas Wash is seasonal in spring and fall when normal migration occurs. A large number of the total species which occur here are transient in one or more of the biotic communities found in the study area and this accounts for the seasonality of use. The creosote, saltbush and desert riparian are the most heavily utilized communities by the majority of permanent and winter resident species excluding water birds. The latter group is restricted almost entirely to the aquatic environment found in marsh and open water communities. This is particularly true of many water fowl which require standing water for feeding.

The total density of birds within the study area is

Table 5. Hunting and Trapping Seasons Established for Game Animals by Nevada Fish and Game Commission for 1974.

variable depending on season. Total bird densities for creosote bush, desert riparian, transitional riparian and marsh communities are given by season in Table 6. No data is available for the other five communities in the study area. These data give some indication of community use by birds, both yearly and by season. The total density of birds is highest in the marsh community if water birds are included in this figure. If these species are excluded, the desert riparian and transitional riparian communities have the highest density, particularly during migration.

Life history data for birds found in the study area are presented in Appendix VIII. These data are taken primarily from Bent (1953). The categories of primary use of habitat and primary food habits are given for each species known to occur in the study area. Primary nest placement is listed only for those species which breed in one of the biotic communities found within the area. Species which do breed there are also expected to feed, water and rest within the same area. In those instances, the latter three categories are not listed under primary habitat use.

Special status where applicable is also given for each species. Unusual or accidental occurrence is also listed for some species. The hunting seasons for some birds as established by the Nevada Fish and Game Commission for 1974 are presented in Table 5. The hunting seasons for 1975 are not yet available.

Many bird species are protected by State and Federal law and two species, the Southern Bald Eagle (Haliaeetus leucocephalus) and the Peregrine Falcon (Falco peregrinus) are listed on both the State and Federal endangered list. (See Table 7). These two species are not common in the study area and probably occur only as transients.

In general, the occurrence and abundance of avian species with the Las Vegas Valley is unusually high for a desert environment (Miller, 1974). Seasonal use and overall mobility of this group of animals accounts for this situation somewhat. The occurrence of a large mesic-hydric environment such as Las Vegas Wash, however, is undoubtedly the controlling factor in the overall avian distribution in the study area.

#### MAMMALS

The distribution and relative abundance of mammals by biotic community is shown in Appendix IX. A total of 48 species of mammal (1 shrew, 18 bats, 2 rabbits, 17 rodents, 9 carnivores and 1 ungulate) are found on the study area. They vary greatly to the extent that they are habitat (community) specific in their distribution. For example, Crawford's desert shrew, muskrat, house mouse, western harvest mouse, and deer mouse are largely restricted to marsh or immediately adjacent communities, whereas almost all bat species are found in all communities. Carnivores and desert sheep, in general, have a wide ecologic

distribution and individuals may range through more than one community during their regular activities. Certain carnivores, such as skunks and raccoon are most abundant in the more mesic communities including marsh. The majority of rodents have their main distribution in the more arid, desert communities, but in some instances have their highest densities adjacent to the more mesic communities including marsh, where more food especially green vegetation is reasonably available. Green vegetation available for browse is necessary for successful reproduction for many desert rodents (Beatley, 1969; Bradley and Mauer, 1971, 1973; Bradley and Deacon, 1971).

Life history information for mammals is given in Appendix X. Hunting and trapping seasons for mammals found on the study area are listed in Table 5. Of particular significance are those species which do not exhibit year-round activity. For example, several rodents enter seasonal hibernation whereas most bats under suitable low temperature conditions enter both daily and seasonal hibernation. Several other species of bats are migratory and spend only a portion of the year in the Las Vegas area. The primary habitat usage by community is given in some detail in App. XI. It is apparent that mesic or hydric communities such as riparian and cliff, transitional riparian, marsh and open water are used for feeding and watering, whereas the more characteristic desert communities are used for resting, hibernation and breeding as suitable shelter in

the form of rock crevices, caves and mine tunnels occur in these communities. Most species also find both food, water, and in some instances, shelter under urban conditions. The combination of few and relatively unsuitable hibernals has forced several species into year-round flight activity (watering and feeding) even in the winter months (O'Farrell and Bradley, 1970). Several species of tree bats (silvery-haired bat, red bat and hoary bat) find shelter (resting, daily hibernating) in trees and only occur in the more typical desert communities during migration.

Other species, for example, most rodents exhibit year-round activity and due to limited home range size, individuals occur only in one community except in ectonal regions between communities. Most rodents are opportunistic or tend toward being omnivorous, although seeds and foliage usually are the most important food items. Even carnivores, in some instances are somewhat omnivorous, and ingest varying amounts of vegetative material, especially fruits.

Only one species, the spotted bat (Euderma maculatum), found in the study area is listed on the threatened and endangered list of Nevada Fish and Game Commission.

1. State laws are taken from the Nevada Fish and Game Commission General Regulation Number 1, effective May 15, 1974.
2. Federal laws are taken from the United States list of Endangered Fauna, effective May, 1974.

## GLOSSARY

Arboreal - Living in trees

Benthic - Bottom regions of a lake

Carrion - Dead animal material

Epilimnion - The upper region of a stratified lake in which the water is uniformly warm and fairly turbulent.

Hibernator - An animal which lives through the winter in a resting condition of reduced metabolic rate and a lowered body temperature.

Homeotherm - An organism which is capable of regulating body temperature by internal heat production.

Hypolimnion - The lower region of a stratified lake in which the water is cold and relatively non-turbulent.

Littoral - The peripheral shallow areas of a lake.

Lotic - Running water

Mesic - Moderately moist habitat.

Metalimnion - The transitional zone between the epilimnion and hypolimnion where the thermal gradient is the steepest (Thermocline).

Pelagic - The open water region of a lake above the Thermocline.

Poikilotherm - An organ<sup>is\*</sup> having no rapidly operating internal heat regulatory mechanism.

Profundal - The open water region of a lake below the Thermocline.

Riparian - Associated with the edge of rivers, dry washes, or currents of water.

Sublittoral - The region of a lake below the littoral zone where the sediments are finer and there is no aquatic vegetation.

Terrestrial - Using or having to do with the earth or land.

Thermocline - The region of a lake of rapid decrease in temperature separating the epilimnion from the hypolimnion.

Volant - Flying

APPENDIX I. Distribution of vascular plants in the Las Vegas Wash Unit, Colorado River Basin Salinity Control Act, Title II study area. Values presented are: A = Abundant, C = Common, U = Uncommon, R = Rare, D = Definite occurrence, H = Hypothetical occurrence. Data taken from Munz (1953), Bradley and Niles (1973). Asterick equals community indicator species.

## APPENDIX II.

Abundance, Distribution and Life History of Fish in the Las Vegas Wash Unit,  
Colorado River Basin Salinity Control Act, Title II Study Area.

| Species by Family                                   | Las Vegas Wash | Las Vegas Bay Boulder Basin | Habitat               | Reproduction  | Food                       |
|---|----------------|-----------------------------|-----------------------|---------------|----------------------------|
| <b>Clupeidae</b>                                    |                |                             |                       |               |                            |
| Treadfin Shad<br>( <u>Dorosoma pentenense</u> )     | -              | abundant                    | pelagic               | May - June    | algae, zooplankton         |
| <b>Salmonidae</b>                                   |                |                             |                       |               |                            |
| Coho Salmon<br>( <u>Oncorhynchus kisutch</u> )      | -              | rare                        | profundal-sublittoral | -             | Shad, zooplankton          |
| Cutthroat Trout<br>( <u>Salmo clarki</u> )          | -              | rare                        | profundal-sublittoral | -             | Shad, zooplankton          |
| Rainbow Trout<br>( <u>Salmo gairdneri</u> )         | -              | abundant                    | profundal-sublittoral | -             | Shad, zooplankton          |
| <b>Catostomidae</b>                                 |                |                             |                       |               |                            |
| Humpback Sucker<br>( <u>Xyrauchen texanus</u> )     | -              | rare                        | pelagic-littoral      | March - April | algae, insects             |
| <b>Cyprinidae</b>                                   |                |                             |                       |               |                            |
| Goldfish<br>( <u>Carassius auratus</u> )            | rare           | -                           | lotic                 | May - Aug.    | algae                      |
| European Carp<br>( <u>Cyprinus carpio</u> )         | rare           | abundant                    | pelagic-littoral      | March - July  | algae, insects, detritus   |
| <b>Ictaluridae</b>                                  |                |                             |                       |               |                            |
| Channel Catfish<br>( <u>Ictalurus punctatus</u> )   | -              | abundant                    | benthic               | May - July    | omnivorous                 |
| <b>Poeciliidae</b>                                  |                |                             |                       |               |                            |
| Mesquitofish<br>( <u>Gambusia affinis</u> )         | rare           | -                           | lotic                 | May - Sept.   | insects                    |
| <b>Serranidae</b>                                   |                |                             |                       |               |                            |
| Stripped Bass<br>( <u>Morone saxatilis</u> )        | -              | rare                        | pelagic-sublittoral   | -             | Shad                       |
| <b>Centrarchidae</b>                                |                |                             |                       |               |                            |
| Bluegill<br>( <u>Lepomis cyanellus</u> )            | rare           | common                      | littoral              | April - Aug.  | Shad, insects, zooplankton |
| Green Sunfish<br>( <u>Lepomis macrochirus</u> )     | -              | common                      | littoral              | April - Aug.  | insects, zooplankton       |
| Largemouth Bass<br>( <u>Micropterus salmoides</u> ) | -              | abundant                    | littoral-sublittoral  | March - June  | Shad, zooplankton          |
| Black Crappie<br>( <u>Pomoxis nigromaculatus</u> )  | -              | abundant                    | littoral-sublittoral  | March - May   | Shad, zooplankton          |

## APPENDIX III.

The Ecological Distribution and relative abundance of amphibians by biotic community in the Las Vegas Wash Unit, Colorado River Basin Salinity Control Act, Title II Study Area. Values expressed as A = Abundant, C = Common and U = Uncommon. Asterick equals community indicator species.

| Species by Family                                 | Creosote bush | Saltbush | Desert Riparian | Riparian Cliff | Transitional Riparian | Marsh | Open Water | Barren | Urban |
|---|---------------|----------|-----------------|----------------|-----------------------|-------|------------|--------|-------|
| <b>Ambystomidae</b>                               |               |          |                 |                |                       |       |            |        |       |
| Tiger Salamander<br>( <u>Ambystoma tigrinum</u> ) |               |          |                 |                |                       | U     | U          |        | U     |
| <b>Ranidae</b>                                    |               |          |                 |                |                       |       |            |        |       |
| Bullfrog<br>( <u>Rana catesbeiana</u> )           |               |          |                 |                | U                     | C     | C          |        |       |
| Leopard Frog<br>( <u>Rana pipiens</u> )           |               |          |                 |                | U                     | C     | C          |        |       |
| <b>Bufonidae</b>                                  |               |          |                 |                |                       |       |            |        |       |
| Desert Toad<br>( <u>Bufo punctatus</u> )          |               |          | U               | U              | C                     | C     |            |        |       |

| Spiny Softshell<br>( <u>Trionyx ferox</u> )                | Spring, summer, fall | Aquatic - littoral zone                    | Aquatic invertebrates, vertebrates - homeotherms |                                       |         |

APPENDIX VII. Seasonal use, occurrence and abundance of birds, in the nine biotic communities of the Las Vegas Wash Unit, Colorado River Basin Salinity Control Act, Title 11 Study Area. Values expressed are: PR = permanent resident, WR = winter resident, SR = summer resident, T = transients, ACC = accidental, A = abundant, C = common, U = uncommon, R = rare, P = probable occurrence and H = hypothetical occurrence. Data from: Austin and Bradley (1971) and Austin (unpublished data).

| Fringed Myotis<br>( <i>Myotis thysanodes</i> )                     | Spring, summer, fall | See Table             | Insectivore, volant      |  | Migratory, hibernator                          |
| Long-legged Myotis<br>( <i>Myotis volans</i> )                     | Spring, fall         | See Table             | Insectivore, volant      |  | Migratory, hibernator                          |
| California Myotis<br>( <i>Myotis californicus</i> )                | Year-round           | See Table             | Insectivore, volant      |  | Hibernator                                     |
| Small-footed Myotis<br>( <i>Myotis subulatus</i> )                 | Spring, fall         | See Table             | Insectivore, volant      |  | Migratory, hibernator                          |
| Silvery-haired Bat<br>( <i>Lasionycteris noctivagans</i> )         | Spring, fall         | See Table             | Insectivore, volant      |  | Migratory, hibernator                          |
| Western Pipistrelle<br>( <i>Pipistrellus hesperus</i> )            | Year-round           | See Table             | Insectivore, volant      |  | Hibernator                                     |
| Big Brown Bat<br>( <i>Eptesicus fuscus</i> )                       | Spring, summer, fall | See Table             | Insectivore, volant      |  | Hibernator                                     |
| Red Bat<br>( <i>Lasiurus borealis</i> )                            | Spring, fall         | See Table             | Insectivore, volant      |  | Migratory, hibernator                          |
| Hoary Bat<br>( <i>Lasiurus cinereus</i> )                          | Spring, fall         | See Table             | Insectivore, volant      |  | Migratory, hibernator                          |
| Scotted Bat<br>( <i>Euderma maculatum</i> )                        | Unknown seasonal     | See Table             | Insectivore, volant      | Threatened & endangered, Federal & State protected | Unknown  |
| Townsend's Big-eared Bat<br>( <i>Macrotus townsendii</i> )         | Year-round           | See Table             | Insectivore, volant      |  | Hibernator                                     |
| Allen's Big-eared Bat<br>( <i>Macrotus phyllotis</i> )             | Year-round           | See Table             | Insectivore, volant      |  | Hibernator                                     |
| Pallid Bat<br>( <i>Antrozous pallidus</i> )                        | Year-round           | See Table             | Insectivore, volant      |  | Hibernator                                     |
| <b>Molossidae</b>  |                      |                       |                          |  |  |
| Brazilian free-tailed Bat<br>( <i>Tadarida brasiliensis</i> )      | Spring, Summer, fall | See Table             | Insectivore, volant      |  | Migratory                                      |

## App. X-2

| Species by Family  | Seasonal             | Primary Habitat Usage | Primary Food Habits   | Special Status               | Remarks   |
|--|----------------------|-----------------------|---|------------------------------|---|
| Big-Free-tailed Bat<br>( <u>Tadarida mollosa</u> )                     | Spring, fall         | See Table             | Insectivore, volant   |                              | Migratory   |
| Greater Hairy Bat<br>( <u>Eumops perotis</u> )                         | Spring, fall         | See Table             | Insectivore, volant   |                              | Migratory   |
| <b>Leporidae</b>   |                      |                       |   |                              |   |
| Desert Cottontail<br>( <u>Sylvilagus auduboni</u> )                    | Year-round           | Breeding              | Vegetation, terrestrial foliage                                   | Protected by State Game Laws |   |
| Black-tailed Jackrabbit<br>( <u>Lepus californicus</u> )               | Year-round           | Breeding              | Vegetation, terrestrial foliage                                   | Protected by State Game Laws |   |
| <b>Sciuridae</b>   |                      |                       |   |                              |   |
| White-tailed Antelope Ground Squirrel<br>( <u>Uromyscus leucurus</u> ) | Year-round           | Breeding              | Vegetation, terrestrial seeds, foliage, terrestrial invertebrates |                              |   |
| Round-tailed Ground Squirrel<br>( <u>Uromyscus tereticaudis</u> )      | Year-round           | Breeding              | Vegetation, terrestrial seeds, foliage; terrestrial invertebrates |                              | More abundant in shady areas, hibernator                        |
| <b>Geomysidae</b>  |                      |                       |   |                              |   |
| Southern Pocket Gopher<br>( <u>Thomomys umbrinus</u> )                 | Year-round           | Breeding              | Vegetation, terrestrial roots - foliage                           |                              | Completely fossorial & especially abundant in urban development |
| <b>Heteromyidae</b>  |                      |                       |   |                              |   |
| Little Pocket Mouse<br>( <u>Pedocratys longimembrous</u> )             | Spring, summer, fall | Breeding              | Vegetation, seeds, foliage  |                              | Hibernator  |
| Long-tailed Pocket Mouse<br>( <u>Pedocratys ferruginea</u> )           | Spring, summer, fall | Breeding              | Vegetation, seeds, foliage  |                              | Hibernator  |
| Merriam's Kangaroo Rat<br>( <u>Dipodomys merriami</u> )                | Year-round           | Breeding              | Vegetation, seeds, foliage  |                              |   |
| Desert Kangaroo Rat<br>( <u>Dipodomys deserti</u> )                    | Year-round           | Breeding              | Vegetation, seeds foliage   |                              | Requires sand dune habitat                                      |
| <b>Cricetidae</b>  |                      |                       |   |                              |   |
| Western Harvest Mouse<br>( <u>Reithrodontomys megalotis</u> )          | Year-round           | Breeding              | Vegetation, seeds, foliage  |                              | Most abundant near water  |
| Canyon Mouse<br>( <u>Peromyscus crinitus</u> )                         | Year-round           | Breeding              | Vegetation, seeds, foliage  |                              | Prefers rocky habitat   |
| Cactus Mouse<br>( <u>Peromyscus eremicus</u> )                         | Year-round           | Breeding              | Vegetation, seeds, foliage  |                              |   |
| Desert Mouse<br>( <u>Peromyscus maniculatus</u> )                      | Year-round           | Breeding              | Vegetation, seeds foliage   |                              | Prefers somewhat mesic habitat                                  |
| Brush Mouse<br>( <u>Peromyscus boylii</u> )                            | Year-round           | Breeding              | Vegetation, seeds, foliage  |                              |   |
| Southern Grasshopper Mouse<br>( <u>Ochetomys cariosus</u> )            | Year-round           | Breeding              | Invertebrates, terrestrial; vegetation, terrestrial.              |                              |   |

| Species by Family                                      | Seasonal   | Primary Habitat Usage | Primary Food Habits  | Special Status                     | Remarks                           |
|--|------------|-----------------------|--|------------------------------------|-----------------------------------|
| Desert Wood Rat<br>( <u>Nectoma lepida</u> )           | Year-round | Breeding              | Vegetation, terrestrial, foliage   |                                    |                                   |
| Maskrat<br>( <u>Ondatra zibethicus</u> )               | Year-round | Breeding              | Vegetation, aquatic, foliage - roots   |                                    | Found in marsh areas only         |
| <b>Muridae</b>   |            |                       |  |                                    |                                   |
| House Mouse<br>( <u>Mus musculus</u> )                 | Year-round | Breeding              | Vegetation, terrestrial foliage, seeds   |                                    | Most abundant near water or urban |
| <b>Canidae</b>   |            |                       |  |                                    |                                   |
| Coyote<br>( <u>Canis latrans</u> )                     | Year-round | Breeding              | Vertebrates, homeotherms, Fur bearer, state poikilotherms, carrion             | regulated season                   |                                   |
| Kit Fox<br>( <u>Vulpes macrotis</u> )                  | Year-round | Breeding              | Vertebrates, homeotherms, Fur bearer, state poikilotherms, carrion             | regulated season                   | Also protected by State law       |
| Gray Fox<br>( <u>Urocyon cinereoargenteus</u> )        | Year-round | Breeding              | Vertebrates, homeotherms, Fur bearer state poikilotherms, carrion              | regulated season                   |                                   |
| <b>Procyonidae</b>                                     |            |                       |  |                                    |                                   |
| Ring-tailed Cat<br>( <u>Spilogale austustus</u> )      | Year-round | Breeding              | Vertebrates, homeotherms, Fur bearer, state vegetation, fruit                  | regulated season                   |                                   |
| Raccoon<br>( <u>Procyon lotor</u> )                    | Year-round | Breeding              | Vertebrates, homeotherms, poikilotherms, vegetation                            | terrestrial fruit                  |                                   |
| <b>Mustelidae</b>                                      |            |                       |  |                                    |                                   |
| Badger<br>( <u>Taxidea taxus</u> )                     | Year-round | Breeding              | Vertebrates, homeotherms   |                                    |                                   |
| Western Spotted Skunk<br>( <u>Spilogale gracilis</u> ) | Year-round | Breeding              | Vertebrates, terrestrial homeotherms, invertebrates                            | Fur bearer, state regulated season |                                   |
| Striped Skunk<br>( <u>Mephitis mephitis</u> )          | Year-round | Breeding              | Vertebrates, terrestrial homeotherms, poikilotherms, invertebrates, vegetation | Fur bearer, state regulated season |                                   |
| <b>Felidae</b>   |            |                       |  |                                    |                                   |
| Bobcat<br>( <u>Lynx rufus</u> )                        | Year-round | Breeding              | Vertebrates, homeotherms, Carrion  | Fur bearer, state regulated season |                                   |
| <b>Bovidae</b>   |            |                       |  |                                    |                                   |
| Mountain Sheep<br>( <u>Ovis canadensis</u> )           | Year-round | Breeding              | Vegetation, terrestrial foliage  | Protected by state game laws       |                                   |
