# **Fundamental Studies of Hydrogen storage and catalysis**

Balakrishnan Naduvalath

Department of Chemistry, UNLV

08/16/07

**\$\$\$:** FCAST project (DOE Grant # DE-FG36-05GO85028)

# Group members/Collaborators

## UNLV

Dr. T. J. Dhillip Kumar (Chemistry)

Dr. Tarakeshwar Pilarisetty (Chemistry)

Dr. Philippe Weck (Chemistry)

Dr. Eunja Kim (Physics)

## External Collaborators

Dr. Hansong Cheng (Air Products & Chemicals, Inc.)

Prof. Robert Forrey (Penn State)

Prof. Boris Yakobson (Rice University)

## Industrial partner

UTC

# Overview

- Catalyst
  - Size effects
  - Alloying
  - Catalyst support
- Hydrogen storage
- Design of novel nanomaterials

# Approach

$$H\Psi = E\Psi$$

- First principles calculations
- Density functional theory
- Allows detailed prediction of electronic structure and ground state properties

# Hydrogen storage systems

- Liquid/compressed hydrogen
- Metal hydrides/chemical hydrides
- Sorption systems
  - Metal-organic frameworks (MOFs)
  - Pristine and functionalized C and BN nanotubes, graphitic systems,...

# Role of Ti as a catalyst/dopant in hydrogen storage materials

## Reversible hydrogen storage in NaAlH<sub>4</sub>

- $\text{NaAlH}_4 \leftrightarrow 1/3 \text{Na}_3\text{AlH}_6 + 2/3 \text{Al} + \text{H}_2 \leftrightarrow \text{NaH} + \text{Al} + 3/2 \text{H}_2$ 
  - The reverse reaction (hydrogenation) occurs much faster in the presence of small amounts of Ti catalyst (*Bogdanovic et al., J. Alloys and Comp. 253, 1 (1997)*)
  - The mechanism of Ti-catalyzed reversible hydrogen storage is still not understood
- Ti-doped nanostructures have also been proposed as potential hydrogen storage media (*Yildirim and Ciraci, Phys. Rev. Lett. 94, 175501 (2005)*)

# Electronic structure of Titanium clusters

- ❖  $\text{Ti}_n$  clusters evolve on **Pentagonal** growth pattern.
- ❖  $\Delta_2 E$  indicates  $\text{Ti}_7$  and  $\text{Ti}_{13}$  clusters are highly stable which agrees well with the experimental **CID** rates.

## Second Energy Difference

$$\Delta_2 E = E(n+1) + E(n-1) - 2E(n)$$

# Energetics of small Titanium clusters

## Binding Energy

$$\Delta E_{BE} = [E(Ti_n) - nE(Ti)] / n, \quad (n=2,3,..15)$$

# Dissociative Chemisorption of H<sub>2</sub> On Titanium clusters

## H<sub>2</sub> Dissociative Chemisorption Energy

$$\Delta E_{\text{CE}} = E_{\text{Ti}_n} + E_{\text{H}_2} - E_{\text{Ti}_n\text{H}_2}$$

Ti<sub>4</sub>

Ti<sub>7</sub>

Ti<sub>13</sub>

$\text{Ti}_{13}\text{H}_2$

$\text{Ti}_{13}\text{H}_8$

$\text{Ti}_{13}\text{H}_{20}$

$\text{Ti}_{13}\text{H}_{28}$

## Average Dissociative Chemisorption Energy

$$\Delta E_{\text{CE}} = (2/m)(E_{\text{Ti}_{13}} + (m/2)E_{\text{H}_2} - E_{\text{Ti}_{13}\text{H}_m}) \quad (m = 2, 4, 6, \dots)$$

$\text{Ti}_{13}\text{H}_{30}$

# Sequential Hydrogen Desorption Energy

$$\Delta E_{\text{DE}} = E_{\text{H}} + (E_{\text{Ti}_{13}\text{H}_m} - E_{\text{Ti}_{13}\text{H}_{m-2}}) / 2 \quad (m = 2, 4, 6, \dots)$$

$\text{Ti}_{13}\text{H}_{28}$

$\text{Ti}_{13}\text{H}_{30}$

# Catalyst-support interaction

Growth of small Pt clusters on  $\alpha$ -Al<sub>2</sub>O<sub>3</sub> surface investigated  
Zhou et al. J. Phys. Chem. C (in press)

## Wetting vs clustering

Pt-monolayer on  $\alpha$ -Al<sub>2</sub>O<sub>3</sub> surface

Pt-cluster on  $\alpha$ -Al<sub>2</sub>O<sub>3</sub> surface

Clustering preferred over wetting

# Effect of Alloying

## Electrostatic Potential Map

(a)  $\text{Pt}_4$

## Total Density of States of $\text{Pt}_4$ and $\text{Pt}_3\text{Co}$

Position of the d-band relative to the Fermi-level has important consequences to the catalytic activity.

# Transition-metal bonded organic systems as building blocks for hydrogen storage materials

- Hydrogen storage capacity of model organometallic systems consisting of **Sc**, **Ti** and **V** transition-metal atoms bound to  $C_mH_m$  rings ( $m=4-6$ ).
- Calculations were performed using the density functional theory (GGA, PW91).
- The maximum retrievable  $H_2$  uptake predicted is **9.3 wt %** using **ScC<sub>4</sub>H<sub>4</sub>**, slightly better than the **9.1 wt %** hydrogen using **TiC<sub>4</sub>H<sub>4</sub>** and much larger than the **7.2 wt %** hydrogen with **VC<sub>4</sub>H<sub>4</sub>**.
- Average binding energies:  
**ScC<sub>4</sub>H<sub>4</sub>(H<sub>2</sub>)<sub>n</sub> : 0.33 eV/H<sub>2</sub>**  
**TiC<sub>4</sub>H<sub>4</sub>(H<sub>2</sub>)<sub>n</sub> : 0.64 eV/H<sub>2</sub>**  
**VC<sub>4</sub>H<sub>4</sub>(H<sub>2</sub>)<sub>n</sub> : 0.77 eV/H<sub>2</sub>**

Optimized geometries of  $ScC_4H_4(H_2)_n$  ( $n=1-5$ )

# H<sub>2</sub> Chemisorption on M-C<sub>4</sub>H<sub>4</sub> systems

## H<sub>2</sub> Chemisorption on M-C<sub>5</sub>H<sub>5</sub> systems

# Carbon nanoframeworks tailored for hydrogen storage

- Novel class of 3-D materials consisting of small diameter single-walled carbon nanotubes (SWCNTs) functionalized by organic ligands are proposed, as potential hydrogen storage media.
- Nanoframeworks consisting of (5,0) and (3,3) SWCNTs constrained by phenyl spacers are constructed.

Optimized nanoframework structure consisting of (5,0) SWCNTs constrained by phenyl spacers. The unit cell is shown in blue.

HOMO (left) and LUMO (right) of pristine (5,0) SWCNTs (top) and the framework (bottom) consisting of (5,0) SWCNTs and phenyl ligands.

# Hydrogen uptake on Li-decorated nanoframework

**Work in progress!**
