The $A_2[\text{ReF}_6]$ ($A = \text{K}, \text{Rb}$ and Cs) salts are isotypic and crystallize in the trigonal space group type $P\bar{3}m1$, adopting the $\text{K}_2[\text{GeF}_6]$ structure type. Common to all $A_2[\text{ReF}_6]$ structures are slightly distorted octahedral $[\text{ReF}_6]^{2-}$ anions with an average $\text{Re}-\text{F}$ bond length of 1.951 (8) Å. In those salts, symmetry lowering on the local $[\text{ReF}_6]^{2-}$ anions from O_h (free anion) to D_{3d} (solid-state structure) occur. The distortions of the $[\text{ReF}_6]^{2-}$ anions, as observed in their Raman spectra, are correlated to the size of the counter-cations.

1. Chemical context

The hexafluoridorhenate(IV) anion has been known for 80 years but its chemistry is understudied with respect to the heavier halogen analogs (Ruff & Kwasnik, 1934). The scarcity of $[\text{ReF}_6]^{2-}$ salts is attributed to the difficulties in their preparation and purification. $\text{K}_2[\text{ReF}_6]$ was the first hexafluoridorhenate(IV) salt to be reported; it was prepared from the solid-state melting reaction (SSMR) of $\text{K}_2[\text{ReBr}_6]$ with KHF_2 (Ruff & Kwasnik, 1934). Almost two decades later, ten salts comprising the $[\text{ReF}_6]^{2-}$ anion and with different counter-cations (Rb^+ , Cs^+ , PPh_4^+ ($\text{Ph} = \text{C}_6\text{H}_5$), $[\text{Ni}(\text{NH}_3)_6]^{2+}$, $[\text{Co}(\text{NH}_3)_6]^{3+}$, $\{[\text{Co}(\text{NH}_3)_6](\text{NO}_3)\}^{2+}$, $\{[\text{Cr}(\text{NH}_3)_6](\text{NO}_3)\}^{2+}$, $[\text{Co}(\text{NH}_3)_5\text{Cl}]^{2+}$, $[\text{Cr}(\text{NH}_3)_5\text{Cl}]^{2+}$, $[\text{Co}(\text{NH}_3)_4(\text{CO}_3)]^{2+}$) had been reported (Peacock, 1956; Weise, 1956; Pedersen *et al.*, 2014; Brauer & Allardt, 1962). Those salts were prepared by cation metathesis starting from $(\text{NH}_4)_2[\text{ReF}_6]$ or $\text{K}_2[\text{ReF}_6]$. However, the synthetic procedure to prepare $(\text{NH}_4)_2[\text{ReF}_6]$ or $\text{K}_2[\text{ReF}_6]$ was not explained in detail. To date, only the structures of two $[\text{ReF}_6]^{2-}$ salts have been characterized by single crystal X-ray diffraction (SCXRD): $\text{K}_2[\text{ReF}_6]$ (measured at 292 K) and $(\text{PPh}_4)_2[\text{ReF}_6]\cdot\text{H}_2\text{O}$ (measured at 122 K) (Clark & Russell, 1978; Pedersen *et al.*, 2014). Similarly, the synthesis of the $\text{K}_2[\text{TcF}_6]$ congener, which was reported in 1963, involves the SSMR of $\text{K}_2[\text{TcBr}_6]$ with KHF_2 followed by an aqueous work-up (Schwochau & Herr, 1963). However, $[\text{TcF}_6]^{2-}$ salts have been reinvestigated recently (Balasekaran *et al.*, 2013), and various routes for the different salts of $A_2[\text{TcF}_6]$ [$A = \text{Na}, \text{K}, \text{Rb}, \text{Cs}$ and $\text{N}(\text{CH}_3)_4$] were reported. These salts were characterized by Raman and IR spectroscopy and by SCXRD. The $A_2[\text{ReF}_6]$ salts could serve as suitable precursors to explore the chemistry of rhenium in the oxidation state IV.

Table 1

 Structural details (Å, °) of the $[\text{ReF}_6]^{2-}$ anion in this study and of the related anion in $[\text{TcF}_6]^{2-}$ salts^a.

	$M-F, M = \text{Re}$	$F-M-F, M = \text{Re}$	$M-F, M = \text{Tc}$	$F-M-F, M = \text{Tc}$
$\text{K}_2[\text{MF}_6]$	1.948 (3)	86.08 (12), 93.92 (12), 180	1.928 (6)	86.93 (5), 93.07 (5), 180
$\text{Rb}_2[\text{MF}_6]$	1.945 (7)	86.5 (3), 93.5 (3), 180	1.933 (3)	87.2 (2), 92.8 (2), 180
$\text{Cs}_2[\text{MF}_6]$	1.9594 (18)	86.86 (7), 93.14 (7), 180	1.935 (5)	87.8 (2), 92.2 (2), 180

 Note: (a) Balasekaran *et al.* (2013).

Here, we revisited the synthesis of $A_2[\text{ReF}_6]$ ($A = \text{K}, \text{Rb}, \text{Cs}$) salts and report their crystal structures determined from single crystal data, and their Raman spectra.

2. Structural commentary

The title alkaline metal salts $A_2[\text{ReF}_6]$ ($A = \text{K}, \text{Rb}, \text{Cs}$) are isotypic. They adopt the $\text{K}_2[\text{GeF}_6]$ structure type (Hoard & Vincent, 1939) and crystallize in the trigonal space group type $P\bar{3}m1$ (Table 1), just like the related $A_2[\text{TcF}_6]$ ($A = \text{K}, \text{Rb}, \text{Cs}$) compounds (Balasekaran *et al.*, 2013). Selected bond lengths and angles of the series of $[\text{ReF}_6]^{2-}$ anions of the present work and the reported $[\text{TcF}_6]^{2-}$ salts (Balasekaran *et al.*, 2013) are presented in Table 1. Representative for all other title compounds, the $[\text{ReF}_6]^{2-}$ anion of the $\text{Cs}_2[\text{ReF}_6]$ salt is given in Fig. 1. The Re^{IV} atom is located on a position with site symmetry $\bar{3}m$. (Wyckoff position 1a) at the origin of the trigonal unit cell. The six symmetry-related fluorine ligands form a slightly distorted octahedral coordination sphere around the rhenium(IV) atom. The $\text{Re}-\text{F}$ bond lengths for the K, Rb, and Cs salts of $[\text{ReF}_6]^{2-}$, 1.948 (3), 1.945 (7) and 1.9594 (18) Å, respectively, are longer than the $\text{Tc}-\text{F}$ bond lengths for the congener K, Rb, and Cs salts of $[\text{TcF}_6]^{2-}$,

Figure 1

Representation of the $[\text{ReF}_6]^{2-}$ anion in $\text{Cs}_2[\text{ReF}_6]$. Displacement ellipsoids are drawn at the 50% probability level. [Symmetry codes: (i) $-x, -y, -z$; (ii) $x - y, x, -z$; (iii) $-x + y, -x, z$; (iv) $-y, x - y, z$; (v) $y, -x + y, -z$.]

1.928 (1), 1.933 (3), and 1.935 (5) Å, respectively (Balasekaran *et al.*, 2013).

In $A_2[\text{ReF}_6]$ ($A = \text{K}^+, \text{Rb}^+, \text{Cs}^+$), each cation is located on a position with site symmetry $3m$. (Wyckoff position 2d) and is surrounded by twelve neighboring F atoms resulting in a $[3 + 6 + 3]$ arrangement with three groups of fluoride ligands with distances of 3.0955 (19) Å (three of such), 3.1655 (6) Å (six of such), and 3.224 (2) Å (three of such) for the Cs^+ salt as a representative of the three $[\text{ReF}_6]^{2-}$ salts. These bond-length distributions are also found in the K^+ and Rb^+ salts of the $[\text{ReF}_6]^{2-}$ complexes. This correlates well and confirms that $A_2[\text{ReF}_6]$ salts are isotypic with $\text{K}_2[\text{GeF}_6]$ and the congener $A_2[\text{TcF}_6]$ ($A = \text{K}^+, \text{Rb}^+, \text{Cs}^+$) (Balasekaran *et al.*, 2013; Hoard & Vincent, 1939). In comparison with the previous structure determination of $\text{K}_2[\text{ReF}_6]$ (Clark & Russell, 1978), the current redetermination resulted in better reliability factors, together with a more precise determination of lattice parameters and atomic coordinates.

3. Raman spectroscopy

As reported previously for $\text{K}_2[\text{ReF}_6]$ and $A_2[\text{TcF}_6]$ ($A = \text{K}, \text{Rb}, \text{Cs}$) (Bettinelli *et al.*, 1987; Balasekaran *et al.*, 2013), the $[\text{ReF}_6]^{2-}$ anions are compressed along the crystallographic c axis, thus lowering the ideal molecular symmetry of the $[\text{ReF}_6]^{2-}$ anions from O_h to D_{3d} in the solid state. The representative unit-cell plot of $\text{Cs}_2[\text{ReF}_6]$ is given in Fig. 2. The effect of symmetry lowering among the alkali metal salts of $[\text{TcF}_6]^{2-}$ and its correlation with the vibrational spectra are

Computer programs: APEX3 and SAINT (Bruker, 2015), SHELXS (Sheldrick, 2008), SHELXL2014 (Sheldrick, 2015), DIAMOND (Brandenburg, 2007) and publCIF (Westrip, 2010).

well described (Balasekaran *et al.*, 2013). Here, a similar trend occurs for the $A_2[ReF_6]$ series ($A = K, Rb, Cs$; Fig. 3). In the case of $K_2[ReF_6]$, the Raman spectrum exhibits four bands at 624, 539, 244 and 224 cm⁻¹. The latter two vibrations correspond to the F_{2g} band split due to the symmetry lowering. In the Raman spectra of $A_2[MF_6]$ complexes ($A = K, Rb, Cs; M = Tc, Re$), the F_{2g} splitting decreases from $K_2[ReF_6]$ to

$Cs_2[ReF_6]$ due to differences in $M-F$ bond length. Furthermore, the slight increase of $M-F$ bond lengths from $K_2[MF_6]$ to $Cs_2[MF_6]$ are well represented in the Raman spectra which causes the Raman bands to shift to lower wavenumbers.

4. Synthesis and crystallization

Ammonium perrhenate, ammonium bifluoride, potassium fluoride, rubidium fluoride, cesium fluoride, and hydrobromic acid (48%) were purchased from Sigma Aldrich and used without any further purification. This work was performed in a well-ventilated fume hood due to the corrosive nature of bifluoride. $K_2[ReBr_6]$ was prepared as described in the literature (Watt *et al.*, 1963), and the detailed synthesis of $A_2[ReF_6]$ ($A = K, Rb, Cs$) is described below. Single crystals of $A_2[ReF_6]$ ($A = K, Rb, Cs$) were obtained by slow evaporation at room temperature of an aqueous solution of the respective salt.

Synthesis of $K_2[ReF_6]$

$K_2[ReF_6]$ was prepared by melting $K_2[ReBr_6]$ (2 g, 2.69 mmol) with excess KHF_2 (14 g, 0.18 mol) in a nickel crucible at 673 K for 30 min in a box furnace. The resulting greyish solid product formed was allowed to cool to room temperature and was washed first with MeOH (4 × 10 ml). Subsequently, the product was washed with several aliquots of an H₂O/MeOH mixture (3 × 5 ml, 1:4 volume ratios) and centrifuged. The pink solid obtained was dissolved in warm water (5–10 ml, 353 K) and evaporated slowly at room temperature. The resultant pink crystals of $K_2[ReF_6]$ were recrystallized from warm water (5 ml, 353 K) and colorless

Figure 3
Raman spectra of $A_2[ReF_6]$ ($A = K, Rb, Cs$).

crystals of $K_2[ReF_6]$ were obtained. Yield: 661 mg, 1.7 mmol (65%). IR (KBr, cm^{-1}): 518, 484 sh (Re–F).

Syntheses of $A_2[ReF_6]$ (A = Rb, Cs) salts

$K_2[ReF_6]$ (151 mg, 0.4 mmol) was dissolved in 4 ml of hot water (353 K). MF ($M = Rb, Cs$) (0.8 mmol) dissolved in 1 ml of hot water (353 K) was added dropwise. The solution was allowed to evaporate slowly at room temperature. Crystals of $Rb_2[ReF_6]$ and $Cs_2[ReF_6]$ were formed in 24 h and washed first with cold water (3×2 ml) to remove other fluoride impurities followed by isopropanol (3×1 ml), and diethyl ether (3×1 ml). $Rb_2[ReF_6]$ yield: 156 mg, 0.33 mmol (83%). IR (KBr, cm^{-1}): 521 (Re–F). $Cs_2[ReF_6]$ yield: 175 mg, 0.276 mmol (77%). IR (KBr, cm^{-1}): 507, 480 sh (Re–F).

IR spectra were measured on a Shimadzu IR Affinity-1 spectrometer between 400 and 4000 cm^{-1} . Raman spectra were recorded on a HORIBA T64000 triple spectrometer operating at 30 mW in subtractive mode. The spectra were taken from pure single crystals at room temperature using the 514.5 nm (Kr/Ar) laser line.

5. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Dirubidium hexafluoridorhenate(IV) (SMB_Rb2ReF6_j)

Crystal data

Rb₂[ReF₆]
 $M_r = 471.14$
 Trigonal, $P\bar{3}m1$
 $a = 5.9926$ (13) Å
 $c = 4.7177$ (10) Å
 $V = 146.72$ (7) Å³
 $Z = 1$
 $F(000) = 203$

$D_x = 5.332$ Mg m⁻³
 Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
 Cell parameters from 1612 reflections
 $\theta = 3.9\text{--}28.3^\circ$
 $\mu = 37.22$ mm⁻¹
 $T = 100$ K
 Hexagonal plate, translucent colourless
 0.08 × 0.07 × 0.04 mm

Data collection

Bruker D8 QUEST
 diffractometer
 Radiation source: sealed tube, Siemens
 KFFMo2K-90
 Curved graphite monochromator
 Detector resolution: 8.3333 pixels mm⁻¹
 φ and ω scans
 Absorption correction: numerical
 (SADABS; Bruker, 2015)

$T_{\min} = 0.11, T_{\max} = 0.30$
 1526 measured reflections
 115 independent reflections
 111 reflections with $I > 2\sigma(I)$
 $R_{\text{int}} = 0.073$
 $\theta_{\max} = 24.9^\circ, \theta_{\min} = 3.9^\circ$
 $h = -7 \rightarrow 7$
 $k = -7 \rightarrow 7$
 $l = -5 \rightarrow 5$

Refinement

Refinement on F^2
 Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.027$
 $wR(F^2) = 0.074$
 $S = 1.30$
 115 reflections
 12 parameters
 0 restraints

Primary atom site location: heavy-atom method
 Secondary atom site location: difference Fourier
 map
 $w = 1/[\sigma^2(F_o^2) + (0.0175P)^2 + 3.5548P]$
 where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} < 0.001$
 $\Delta\rho_{\max} = 1.91$ e Å⁻³
 $\Delta\rho_{\min} = -1.36$ e Å⁻³

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Dicaesium hexafluoridorhenate(IV) (SMB_Cs2ReF6_1a)

Crystal data

Cs₂[ReF₆]

$M_r = 566.02$

Trigonal, $P\bar{3}m1$

$a = 6.268$ (1) Å

$c = 4.931$ (1) Å

$V = 167.77$ (6) Å³

$Z = 1$

$F(000) = 239$

$D_x = 5.602$ Mg m⁻³

Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å

Cell parameters from 135 reflections

$\theta = 3.8\text{--}32.6^\circ$

$\mu = 28.83$ mm⁻¹

$T = 100$ K

Hexagonal plate, clear colourless

0.25 × 0.12 × 0.11 mm

Data collection

Bruker D8 QUEST

diffractometer

Radiation source: sealed tube, Siemens

KFFMo2K-90

Curved graphite monochromator

Detector resolution: 8.3333 pixels mm⁻¹

φ and ω scans

Absorption correction: multi-scan

(SADABS; Bruker, 2015)

$T_{\min} = 0.05$, $T_{\max} = 0.15$

2683 measured reflections

218 independent reflections

218 reflections with $I > 2\sigma(I)$

$R_{\text{int}} = 0.040$

$\theta_{\max} = 30.4^\circ$, $\theta_{\min} = 3.8^\circ$

$h = -8 \rightarrow 8$

$k = -8 \rightarrow 8$

$l = -7 \rightarrow 7$

Refinement

Refinement on F^2

Least-squares matrix: full

$R[F^2 > 2\sigma(F^2)] = 0.013$

$wR(F^2) = 0.036$

$S = 1.25$

218 reflections

13 parameters

0 restraints

Primary atom site location: structure-invariant

direct methods

Secondary atom site location: difference Fourier

map

$w = 1/[\sigma^2(F_o^2) + (0.0181P)^2 + 0.1419P]$

where $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} < 0.001$

$\Delta\rho_{\max} = 0.68$ e Å⁻³

$\Delta\rho_{\min} = -2.92$ e Å⁻³

Extinction correction: SHELXL2014

(Sheldrick, 2015)

Extinction coefficient: 0.029 (2)

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
