Emotional Intelligence is a multi-faceted construct. Existing tests do a good job of measuring some aspects of Emotional Intelligence. The Metaphors Test (Barchard, 2004) was designed to measure the ability to decipher the emotional content of ambiguous sentences. This test may measure a new facet of Emotional Intelligence. The purpose of this research was to establish construct validity of the Metaphors Test as a measure of Emotional Intelligence. Using a sample of 281 undergraduates, the Metaphors Test was correlated with the four branches of the Mayer-Salovey-Caruso Emotional Intelligence Test (MSCEIT; Mayer, Salovey, & Caruso, 2004). Perceiving Emotions, Using Emotions, Understanding Emotions, and Managing Emotions. The four correlations were all moderate, positive, and statistically significant. These results provide promising evidence of construct validity. Future research should select the items with the highest correlations with the MSCEIT. This will enable researchers to create a revised, shorter version of the Metaphors Test with higher construct validity.

INTRODUCTION

Emotional Intelligence is a broad concept. It includes the ability to perceive, comprehend, and manage emotions, the ability to use emotions to assist thinking, and the ability to reason and problem solve on the basis of emotions (Tsaousis & Nikolau, 2005). Some authors say Emotional Intelligence includes social skills, emotional awareness, leadership skills, interpersonal intelligence, and many other aspects of emotion and cognition (Dizén, Berenbaum, & Kerns, 2005). To test whether all of these facets are related to each other and how these facets are related to important outcome variables, we need good measures of each aspect of Emotional Intelligence. The goal of the present study is to examine the construct validity of a new test of Emotional Intelligence, the Metaphors Test (Barchard, 2004).

The Metaphors Test (Barchard, 2004) uses a new approach to measuring Emotional Intelligence. For each of 48 emotions, respondents are asked to rate several different emotions. Metaphors may be a useful way of measuring Emotional Intelligence, because metaphors and other types of figurative language are often used to express emotions (Fainsilber & Ortony, 1987; Davitz, 1969). People describing intense emotions use more metaphors than people describing mild emotions, and this is especially true when people describe their actual feeling states (Fainsilber & Ortony, 1987). Perhaps metaphors are useful when describing emotions because emotions are transitory and may be hard to be described literally. Describing inexpressible language is the main reason for using metaphors (Fainsilber & Ortony, 1987). If metaphors are useful for expressing emotions, then one aspect of Emotional Intelligence is the ability to decode the emotional meaning of metaphors.

Emotional Intelligence is associated with important real life outcomes. Emotional Intelligence correlates positively with life satisfaction and well-being, educational achievement, relationship success, and work and leadership success (Tsaousis & Nikolau, 2005). In addition, Emotional Intelligence correlates negatively with poor physical and psychological health, job related stress (Tsaousis & Nikolau, 2005), bullying, violence, tobacco use, deviance, and drug abuse (Mayer et al., 2004). To determine which aspects of Emotional Intelligence are the most important, we must measure all aspects of this multi-faceted concept.

METHOD

Participants

The 231 participants (163 female, 118 male) ranged in age from 18 to 50 (mean 19.98, standard deviation 3.52). They identified themselves as 58.2% Caucasian, 12.9% Hispanic, 12.1% Asian, 8.2% African American, 5.4% Pacific Islander, and 3.2% other.

Measures

The Metaphors Test

The Metaphors Test (Barchard, 2004) was designed to measure one aspect of Emotional Intelligence: the ability to decipher the emotional content of ambiguous written information. It includes 48 metaphors. For each metaphor, there are 5 to 9 emotions. The instructions state: “Consider each of the following metaphors. Imagine that someone said this metaphor to you. Try to imagine what they are feeling. Then use the following response to indicate to the extent to which the person is feeling each of the emotions given.” Respondents rate each emotion using a five-point scale (1 = not at all, 2 = a little, 3 = somewhat, 4 = a lot, 5 = extremely).

Mayer-Salovey-Caruso Emotional Intelligence Test (MSCEIT)

The Mayer-Salovey-Caruso Emotional Intelligence Test (MSCEIT; Mayer, 2004) includes 141 items, and measures four branches of Emotional Intelligence: perceiving emotions, using emotions, understanding emotions, and managing emotions. The goal of the present study is to examine the construct validity of a new test of Emotional Intelligence, the Metaphors Test (Barchard, 2004).

The purpose of this study was to examine the construct validity of the Metaphors Test (Barchard, 2004). We found moderate, positive, statistically significant correlations between the Metaphors Test and the four branches of the MSCEIT. These correlations are high enough to provide promising evidence of construct validity, without being so high that they would suggest that the Metaphors Test adds nothing new. Emotional Intelligence is a broad multi-faceted construct, and the Metaphors Test appears to be a promising measure of a new facet of this construct.

Future research should refine the Metaphors Test. The Metaphors Test currently contains 48 metaphors, each of which has 5 to 9 emotions. There are a total of 335 items. Future research should select the best metaphors and the best emotions for each metaphor, to shorten the test while maintaining construct validity. In addition, future versions of this test could include simpler literary forms, such as analogical and declarative statements. This might allow the test to be used with respondents who have lower reading skills.

Future research should explore the relationship between the Metaphors Test and important real world outcomes. Other tests of Emotional Intelligence are associated with success at work, school, and in one’s personal life (Mayer et al., 2004; Tsaousis & Nikolau, 2005). Does the Metaphors Test also predict these outcomes? Furthermore, future research should measure verbal ability or the ability to interpret literate metaphor, to determine whether it is knowledge of the emotional content of the metaphors that is critical to success.
